Community Health Needs Assessment

Approved December 14, 2022
# Executive Summary

TO THE BOARD OF TRUSTEES OF
OCHSNER MEDICAL CENTER - HANCOCK

Ochsner Medical Center - Hancock
Hancock Community Health Needs Assessment

This report represents the Hancock Community Health Needs Assessment conducted through a collaborative process involving the Hancock Community Health Needs Assessment steering committee, the Hancock Community Engagement and Transparency group, and Ochsner Medical Center - Hancock (Ochsner Hancock). It was produced using best practices for community engagement and transparency, and adheres to the Centers for Disease Control and Prevention’s Healthy People 2030 guidelines and standards for a community health needs assessment (CHNA).

This report includes four components:

1. Executive Summary
2. About the Hospital
3. The Community Health Needs Assessment
4. Community Input

The Hancock Community Health Needs Assessment is published annually.

Janet Wiegand, Ph.D.
Executive Director, Ochsner Hancock
January 10, 2023
Executive Summary

In April 2018, Ochsner Health System assumed operations of Hancock Medical Center. Ochsner Medical Center (OMC) - Hancock remains a non-profit hospital located in downtown Bay St. Louis, Mississippi and continues to expand services. Ochsner is committed to improving health across the Mississippi Coast. OMC-Hancock contracted with Horne to develop the Community Health Needs Assessment (CHNA) and Community Health Implementation Plan (CHIP) reports. This report serves as the Hancock Medical Center CHNA report for 2022, and meets the requirements set forth by the IRS in Notice 2011-52, 990 Requirements for non-profit hospitals’ CHNA.

The CHNA report contains secondary data from existing sources, such as U.S. Census, Mississippi Department of Health, Center for Disease Control and Prevention, and ESRI Demographics. This report also includes input from key informants in the region, particularly those with special knowledge of public health, the health of the communities served by the hospital, and/or vulnerable populations in the communities served by the hospital. Community input was gathered through interviews, a focus group, and a community survey. Priorities were selected, in part, based on issue prevalence and severity according to county secondary data, as well as input provided by stakeholders.

As a result of the CHNA process, these community health needs were identified as top priorities:

- Access to and Continuity of Care
- Health Literacy and Education
- Mental and Behavioral Health
- Health Equity

OMC-Hancock thanks everyone in our community that participated in the focus group meeting, interviews, and completed surveys to assist us in conducting this needs assessment. We look forward to working closely with our community to help improve the overall health of the people we serve.

Jeff Edge
Chief Executive Officer
Ochsner Medical Center – Hancock
About the Hospital

Ochsner Medical Center - Hancock

On April 1, 2018, Ochsner Health System assumed operations of Hancock Medical Center. Ochsner Medical Center (OMC) – Hancock remains a non-profit hospital located in downtown Bay St. Louis, Mississippi. The long-term lease agreement expanded the 2013 partnership between Hancock County and Ochsner. Goals of the transition included preserving and expanding services, investing in electronic medical records, and improving physician and patient experience. Ochsner continues to expand services and is committed to the Mississippi Coast providing over 100 beds, over 100 physicians, and nearly 300 professional staff members. Areas of specialty include Oncology, General Pediatrics, ENT, Pain Management, Women’s Services, Cardiology, Obstetrics, Podiatry, Surgery, and more.
The Community Health Needs Assessment

The Community Health Needs Assessment defines opportunities for health care improvement, creates a collaborative community environment to engage multiple change agents, and is an open and transparent process to listen and truly understand the health needs of Hancock County. It also provides an opportunity for the hospital to identify valuable collaborative partners as we try to better serve the community and improve the health of our citizens.

The federal government now requires that non-profit hospitals conduct a community health assessment. These collaborative studies help health care providers build stronger relationships with their communities, identify needs, and dedicate funding and other resources toward programs that clearly benefit local residents.

Community Engagement and Transparency

We are pleased to share with our community the results of our Community Health Needs Assessment. The following pages offer a review of the strategic activities we have undertaken during the last three years as we responded to specific health needs we identified in our community. The last three years presented a particular challenge for our hospital as we responded to the unprecedented health needs the pandemic brought to our service area.

The report also highlights the updated key findings of the assessment. We hope you will take time to review the health needs of our community as the findings impact each and every citizen of our rural Mississippi community. Also, review our activities in response to the needs identified in 2019. Many of the strategic actions we had planned were unable to be implemented due to our hospital’s and our community’s response to COVID-19. The hospital’s financial and human resources were redirected to the immediate needs created by the pandemic. Additionally, we chose not to bring large groups of people together for screenings and health education opportunities.

Data Collection

Primary and secondary data was gathered, reviewed, and analyzed so the most accurate information was available in determining the community’s health needs and appropriate implementation process.

Primary Data: collected by the assessment team directly from the community through conversations, focus groups, digital public survey, and community forums.

Secondary Data: collected from sources outside the community and from sources other than the assessment team; information that has already been collected, collated, and analyzed; provides an accurate look at the overall status of the community.
About the Community

Service Area

Hancock County is the southernmost county of the U.S. State of Mississippi and is named for Founding Father John Hancock. As of the 2020 census, the population is 46,053. Its county seat is Bay St. Louis.

Hancock County is part of the Gulfport–Biloxi, MS Metropolitan Statistical Area. It is situated along the Gulf of Mexico and the state line with Louisiana. The area is home to the John C. Stennis Space Center, NASA’s largest rocket engine test facility.

In 2005, the eye of Hurricane Katrina made landfall in Hancock County. The damage to the land, trees, waterways, and structures was devastating. The county’s communities and infrastructure suffered some of the most intense damage inflicted by that storm.

Homes as far inland as 10 miles were flooded by the storm surge, spreading the damage from the beach to the northern communities of the county.

- 2,714 households receiving food stamps/SNAP
- 6,078 households with 1+ persons with a disability
- 475 households with no vehicles (ACS 5-Yr)

Community Input

Community Survey

Community health needs were identified by collecting and analyzing data and information from multiple quantitative and qualitative sources. Considering information from a variety of sources is important when assessing community health needs, to ensure the assessment captures a wide range of facts and perspectives and to assist in identifying the highest-priority health needs. One of the most important sources is to seek input directly from those we serve.

A community survey was developed by the hospital. Members of the general public were encouraged to participate in the digital survey. The survey was easily available online via a clickable link or by scanning a QR code. Printed cards with the QR code and instructions were made available in public places and were included with a variety of correspondence from the hospital. The CHNA Steering Committee was encouraged to share access to the survey with the various publics they represented. The data collected from the survey was part of the input used by the Steering Committee in establishing priorities.

The survey can be found at the end of this report in Appendix A.

There were 81 responses to the community survey. The typical respondent was 36 years of age, female, white, and college educated. She lived in Hancock County and the majority of the respondents lived in the 39525 ZIP code. The primary city for this ZIP code is Diamondhead, MS.

The perception of the respondents was that Hancock County is a safe place to live and there were few concerns about the environment. There is an awareness that not all of the community has access to quality care and that public transportation is extremely limited, making access to health care providers difficult.
Community Survey (Continued)

Obstacles to having a healthier community are alcohol, tobacco, and substance abuse. These along with a lack of physical activity and healthy eating choices are concerns.

The diseases, entities and lifestyle issues that the respondents are readily aware of are heart disease, diabetes, cancer, and weight management. Mental health is considered a significant issue in the service area. The lack of treatment options for behavioral health care is extremely limited.

Suggestions for lifestyle improvement were more walking trails and opportunities for public physical activity, as well as options for healthier food sources. Events that emphasize the arts and community involvement were recommended as ways of improving the overall health of the community.

It was of particular interest to learn where the community turns for health information. This was apparent when responding to the question of where one turned for their COVID-19 information. The sources included television, primary care physicians, and 23% cited the Center for Disease Control and Prevention.

The complete summary of the survey results can be found in Appendix B.

CHNA Steering Committee

The committee is responsible for the oversight, design, and implementation of the CHNA. It will continue to collect information, establish community relationships, and oversee the budget and funding sources. Adhering to an agreed upon timeline, the committee will generate, prioritize, and select approaches to address community health needs. The committee will also monitor, quarterly, the implementation of the 2022 health initiatives. It will remain aware of any changing needs or health care issues and redirect the health improvement activities as appropriate.

The hospital’s administrator developed the hospital steering committee. The appointed members are listed below. Other members may serve on the steering committee as the committee’s work progresses and special expertise or insight may be needed.

Hospital Steering Committee

Deshanda Bryant – Food and Nutrition Manager, OMC – Hancock
Hillary Davis – Regional Director of Diversity and Inclusion
Jessica Diedling – Associate Program Manager – Community Benefit, Ochsner Health
Jeff Edge – CEO, Ochsner – Hancock
Melanie Hotard – Supervisor of Volunteer Services & Community Outreach, OMC – Hancock
Melissa Kappel – CNO, OMC – Hancock
Suni LeBeouf – AVP Community and Public Affairs, Ochsner Health
Lynn Necaise – Director of Quality, OMC – Hancock
Mary Proby – Mississippi Department of Health
Rhonda Rhodes – Hancock Resource Center
Monica Soroè – Chief Nurse, Mississippi Department of Health
Timmy Thrash – AVP – Associate Administrator, OMC – Hancock
LaShea Wilson – Hancock High School Nurse Teacher, Hancock School District
Community Focus Group

A Community Focus Group was held on November 2, 2022. The participants in this diverse group were carefully selected because they each represented a specific segment of the populations served. In addition, they can act as a continuous conduit between the community and the leadership of the hospital. Careful consideration was given in choosing participants who represented an inclusive blend of the community served. These participants contributed to a structured discussion which was impartially facilitated by a health care consultant from HORNE of Ridgeland, Mississippi.

This focus group provided a deliberative venue for learning, trust-building, creative problem solving, and information gathering, which ultimately served as a valuable resource for the CHNA Steering Committee as it developed the hospital’s health priorities for the next three years. Since the focus group was based on open communication and critical deliberation, it will hopefully lead to improved community relations, trust, and collaborative partnerships as the hospital strives to improve the overall health of the community.

Participants in the Community Forum:

- John Brdecka – Executive Director, Hancock County Library System
- Jeremy Burke – Zoning Administrator, City of Bay St. Louis
- Cynthia Chauvin – President, Rotary Club & Executive Director, CASA
- Nancy Depreo – Mayor of Diamondhead
- Mike Fabre – Mayor of Bay St. Louis
- Terry Lynn Hilliard – Pastor, Bay St. Louis Main Street Methodist Church
- Rhett Ladner – Interim Superintendent, Hancock School District
- Rhonda Rhodes – Hancock Resource Center
- Catherine Tibbs – Excel by 5 Program, Hancock School District
- Tish Williams – Executive Director, Hancock Chamber of Commerce
- LaShea Wilson – High School Nurse, Hancock School District

Invited but Unable to Attend:

- Mary Proby – Mississippi Department of Health
- Albert Ragas – Site EHS & S Manager, Sabic
- Monica Soroe – Chief Nurse, Mississippi Department of Health
- Monty Strong – Fire Chief, City of Bay St. Louis
- LaShea Wilson – High School Nurse, Hancock School District

Community Input

The Community Focus Group was just one way the hospital gained insight from those the hospital serves. Each participant brought valuable input about various population groups of the county. Those who were invited, but were unable to attend, have been encouraged to share their knowledge of specific health needs with the hospital administrator and the CHNA Steering Committee.
Community Input, Continued

A variety of health care topics were introduced to the group for discussion. These discussion points were intended to solicit insights into problems and to discover the perceptions of the participants in the group. Discussion topics included:

- Access to quality health care
- Providing needed services to vulnerable populations
- Understanding social determinants of health’s impact on the health of the community
- Expanding coverage for services to the broader community
- Understanding the impact of lifestyle on the health of the community
- Awareness of prevalent disease entities in the service area
- Mental health needs in the community
- Use of tobacco, alcohol, and drugs

The group expressed concern over the problem of access to affordable services, especially for underserved segments of the population. In many cases, it is not that the service is not available within the county but transportation to the site where the service is provided is not available. Many members of the county with lower incomes have limited access to private transportation and public transportation in the county is extremely limited. In the northern part of the county, there are few health service providers.

Through the discussion, it was determined that there are actually more primary care and specialty services available than the general public is aware. There are various providers but the awareness of their services is not widely known in the county. Communicating the availability of the services and how to access them was identified as one of the main perceptions of the problem of access.

Affordability was discussed and the expansion of the Medicaid program in Mississippi was identified as one of the obvious solutions. The expansion of the payment program would be particularly important to the more vulnerable population. In rural communities, people often lack adequate access to basic preventive health care services to treat chronic diseases, and many uninsured people avoid doctor’s visits until it’s a life-or-death scenario. The pandemic has underscored how those inequities can be deadly.

In the discussion group, there was agreement that the approach to Medicaid expansion should not be viewed as a political issue but as a health issue. The community should rally behind this initiative, not just the health care providers.

Many of the primary fatal diseases in the county are lifestyle related, diseases such as certain heart diseases, various cancers, lung issues, and diabetes. Poor nutrition, lack of physical activity, tobacco and alcohol use, obesity and drug abuse. The Focus Group recognized the strong correlation between an unhealthy southern lifestyle and poor health. Education was acknowledged as one of the most important ways to begin to help people understand the importance of disease prevention.

“It is sad to see a young fifth grader vaping – it is only the beginning.”
Community Input, Continued

Mental health, both for adults and youth, was a concern for all in the focus group. According to Mental Health America, Mississippi ranked number 48 of 51 states or territories. MHA uses a complex set of criteria to categorize and rank each state. Their overall ranking specifically weighs the prevalence of mental health issues in a state with an estimated rate of access to care to address those issues. Those states ranked 1-13 have a lower prevalence of mental illness and a higher rate of access to care, while those states ranked 39-51 show a higher prevalence of mental illness and a lower rate of access to care. Over 70% of children in Mississippi with major depression did not receive treatment. That rate precedes even the national percentage,

“The Pandemic accelerated a need for mental health services among our youth.”

Key Informant Interviews

The following community leaders were interviewed one on one, by a health care consultant, in an effort to gain individual insights into the overall health of Hancock County. They were also encouraged to offer input relative to social determinants of health.

Scotty Adam – Hancock County Board of Supervisors, President
Dr. Raymond Barnes – V.P. Pearl River Community College, Hancock Campus
Janita Cole – Retired Senior Volunteer Program
The Honorable Mike Favre – Mayor of the City of Bay St. Louis
The Honorable Trent Favre – Hancock Youth Court Judge
Arlene Johnson – Hancock County Senior Citizen Center
Connie Lyons – Director, King’s Kitchen

Key Informant Perceptions

Recurring themes from the interviews:

- Mental health resources
- Substance abuse
- Transportation and access to health care
- Homeless population
- Prevention and wellness
- Health Equity

There is a serious shortage of mental health treatment across the Gulf Coast. This is true for inpatient facilities as well as outpatient and basic behavioral health counseling. The problem is particularly severe for youth who are dealing with mental health issues.

There are limited programs for those with substance abuse. This is especially true for those who are homeless. They are more vulnerable because of depression and drug and alcohol abuse. These health issues seem to be more prevalent in the male homeless population.
Key Informant Perceptions, Continued

According to a health care professional who has experienced patient encounters in both public and private settings, “Drug use, overdose, and substance abuse are huge in Hancock County. Treatment for these problems is not available.”

It was expressed that alcohol use was not talked about enough. It is felt that alcohol can be “the hook” for other addictions. The proliferation of THC with minors is tremendous. This is a really dangerous beginning to other abuses. Opioids, especially fentanyl, are extremely dangerous and are becoming more and more popular.

There is not a strong public transportation system in Hancock County. There are limited shuttles and buses that provide access to a few health services. However, most of these kinds of transportation are available only to a limited population, such as senior citizens or patients with disabilities. Private transportation, like taxis or Uber and Lift, are not readily available in the county.

Because of limited government funding, many health services are simply not affordable. Often, the availability of affordable services is not well communicated to those with the greatest need.

“Mississippi needs to expand Medicaid. We leave too much on the table every year.”

The homeless population in Hancock County has many social issues which negatively affect their health. Lack of financial resources impacts their lives in many ways – limited access to healthy food, substandard or no housing, inability to seek treatment, no transportation and can’t afford medications.

Dental care is a major need for this population and there are few options for this care. The homeless, understandably, frequently suffer from depression or other mental illnesses. Alcohol and drugs are abused as a solution to the problem. This lifestyle makes the homeless more prone to chronic illness. The lack of transportation and financial resources, the lack of trust in a structured system and not having a strong sense of belonging and community, negatively affect their mental and physical health.

Wellness and prevention do not appear to be priorities for the majority of the population of the county. Many residents would rather use the emergency department or an urgent care clinic to treat an immediate health issue, rather than routinely visit a primary care provider. This is particularly harmful for patients with chronic illnesses. Health education could help this problem and facilitate transitioning the mindset from urgent care to primary care, wellness, and prevention.

“Addiction is like heart disease, you don’t cure it, you manage it. We need to change that mindset.”
Rural Health Disparities

Rural Americans are a population group that experiences significant health disparities. Health disparities are differences in health status when compared to the population overall, often characterized by indicators such as higher incidence of disease and/or disability, increased mortality rates, lower life expectancies, and higher rates of pain and suffering. Rural risk factors for health disparities include geographic isolation, lower socioeconomic status, higher rates of health risk behaviors, limited access to health care specialists and subspecialists, and limited job opportunities. This inequality is intensified as rural residents are less likely to have employer-provided health insurance coverage, and if they are poor, often are not covered by Medicaid.

According to the Center for Disease Control and Prevention, chronic diseases are the leading causes of death and disability in America, and they affect some populations more than others. People who live in rural areas, for example, are more likely than urban residents to die prematurely from all of the five leading causes of death: heart disease, cancer, unintentional injury, chronic lower respiratory disease, and stroke. These rural health disparities have many causes.

What are the Causes of Rural Health Disparities?

The origins of health disparities in rural America are numerous and vary by region. Some frequently cited factors underlying rural health disparities include health care access, socioeconomic status, health-related behaviors, chronic conditions, and more.

- **Health Behaviors:** Rural residents often have limited access to healthy foods and fewer opportunities to be physically active compared to their urban counterparts, which can lead to conditions such as obesity and high blood pressure. Rural residents also have higher rates of smoking, which increases the risk of many chronic diseases.

- **Health Care Access:** Rural counties have fewer health care workers, specialists (such as cancer doctors), critical care units, emergency facilities, and transportation options. Residents are also more likely to be uninsured and to live farther away from health services.

- **Healthy Food Access:** National and local food studies suggest that residents of low-income, minority, and rural neighborhoods often have less access to supermarkets and healthy foods.

- **Demographic Characteristics:** Residents of rural areas tend to be older, with lower incomes and less education than their urban counterparts. These factors are linked to poor health.
Social Determinants of Health

What Determines our Health?

This CHNA report has provided many statistics on what diseases and life-threatening occurrences are attributable to the mortality rates of the residents of Hancock County. We must keep in mind for every one death that is illustrated in these statistics, there are tens more who are fortunate enough not to have died but may continue to live only through constant hospitalizations and frequent medical intervention. So, the actual health care costs and demands on the health care delivery system are much greater for trying to maintain the quality of life for those who are living with these medical conditions.

Our health is greatly impacted by three major factors. First, is heredity. Many people are born with genetic pathways that make them much more susceptible to various disease entities. Second, is the way we live – our lifestyle. Nutrition, exercise, and life habits, like smoking, abuse of alcohol and drugs, plus other risky behaviors, are components of one’s lifestyle. The third is called social determinants of health. These are social and environmental influences which are frequently beyond one’s control.

Social Determinants of Health

According to the Centers for Disease Control and Prevention, social determinates of health (“SDOH”) are conditions in the places where people live, learn, work, and play that affect a wide range of health risks and outcomes.

These circumstances are shaped by the distribution of money, power, and resources at global, national, and local levels. Social determinants of health are mostly responsible for health inequities – the unfair and avoidable differences in health status seen within and between countries.

The CDC’s Healthy People 2030 Outlines Five Key Areas of SDOH:

Health care Access and Quality

The connection between people’s access to and understanding of health services and their own health.

This domain includes key issues such as access to health care, access to primary care, health insurance coverage, and health literacy.

Education Access and Quality

The connection of education to health and well-being.

This includes key issues such as graduating from high school, enrollment in higher education, educational attainment in general, language and literacy, and early childhood education and development.
Social and Community Context

*The connection between characteristics of the contexts within which people live, learn, work, and play, and their health and well-being.*

This includes topics like cohesion within a community, civic participation, discrimination, conditions in the workplace, and incarceration.

Economic Stability

*The connection between the financial resources people have – income, cost of living, socioeconomic status – and their health.*

This area includes key issues such as poverty, employment, food security, and housing stability.

Neighborhood and Built Environment

*The connection between where a person lives – housing, neighborhood, and environment – and their health.*

This includes topics like quality of housing, access to transportation, availability of healthy foods, air and water quality, and neighborhood crime and violence.

Most Unhealthy State 2022

Health can be defined as being free from illness or injury or as a person’s mental or physical condition. The World Health Organization defines health as a state of complete physical, mental, and social well-being and not just the absences of disease or infirmity. Health has different meanings for different people and is measured differently for everyone. Some people place levels of health more on appearance, weight, and physical fitness, while others place more value on mental well-being. Others may focus on the absence of medical conditions and diseases. The United States, by far, spends the most on health care, more than any other country. Despite this, the country still struggles with a high prevalence of chronic health conditions and preventable deaths.

Levels of Health Among States

Like many other things, health levels and statistics are not uniform across all 50 states. This is evident in obesity rates across the country. Obesity is a major health problem in the United States. It can lead to other serious health problems such as certain types of cancer, type 2 diabetes, heart disease, and stroke. The Centers for Disease Control and Prevention (CDC) reported that the adult obesity rate in the U.S. was 42.4% in 2017 – 2018. This is a significant increase from 30.5% in 1999 – 2000. The states with the highest obesity rates are West Virginia, Mississippi, Alabama, and Louisiana.

The prevalence of diabetes in the U.S. has increased from 9.5% to 10.9% from 2012 to 2018. While healthy behaviors and active lifestyles are the largest contributors to good health, health can be affected by several factors, including housing, financial safety (especially household income), lifestyle/culture, employment, community safety, education, and environment. Since these factors can vary greatly between states, each state has a different overall level of health and well-being.
Mississippi is Number One, Again

Mississippi has consistently been the country’s most unhealthy state for several years. While Mississippi has a low drug death rate and low prevalence of excess drinking, it falls behind in many other categories. About 32% of Mississippi residents report getting no regular exercise, making it the most physically inactive state in the U.S. This rural state also has the highest obesity rate in the country of 39.5%.

The Impact of the COVID-19 Pandemic

The COVID-19 pandemic’s impact on our communities throughout America, and especially small rural communities, has altered the delivery of and access to health care. Every year, various regions of the U.S. are impacted by disaster, whether it is hurricanes on the Gulf Coast or forest fires on the West Coast. Because these events are somewhat annually predictable, health care providers are prepared with procedures and supplies necessary to care for these usually short term and isolated events.

However, COVID-19 was not predicted, and our health care system was not prepared. The human resource pool, the supply chain, and the financial resources were all stretched to the max. Protocols and physical plants were not ready to handle the influx of seriously ill patients. Health education and prevention opportunities and practices were not in place. Thankfully, dedicated health care workers, clinics, and hospitals answered the call and accepted the challenge.

The number one objective was to care for and protect our communities from this pandemic. Carefully crafted community health care agendas were put aside, and all resources were channeled to act and react to serve our communities. The amazing collaborative efforts of local governments, health departments, first responders, the private sector, and the committed health care workers made the seemingly impossible happen.

As stated earlier, many planned activities, some of which were part of our CHNA implementation plan, had to be put on hold. Human and financial resources were needed on the “frontline.” Consequently, many health initiatives were not able to be implemented. Health education opportunities and public screenings could not happen because of the risk of bringing groups of people together.

There were many positives that came from this crisis. Communities worked together. Health care professionals were publicly appreciated and applauded for their commitment to caring, and communities, especially in rural America, found a reason to renew their trust in their small community hospital. Hospitals can look more wisely to the future because of lessons learned during this experience.

Although several of our health prevention and wellness activities were postponed, there were opportunities to initiate other activities that were created as a result of our last Community Health Needs Assessment. Those that were not implemented were carefully considered and new strategic health initiatives were developed.
## 2019 CHNA Strategic Action Responses

### Health Priority 1: Improve Disease Management

**Priority Strategy:** Improve tracking of chronic illness within our community.

**Anticipated Outcomes:** Improving community health by ensuring patients are actively participating in monitoring and managing their chronic health issues.

Responding to the Community

What We Learned

The information gathered from the community was very uniform and was also consistent with the quantitative data. The most common needs mentioned by the community members were related to chronic diseases, health education, lifestyle improvement and access to care.

Being aware of this lifestyle disparity, the Steering Committee was diligent in addressing these chronic illnesses which lead to a disproportionate number of deaths. Also, the quality of life in our state is negatively impacted by these conditions that rob our citizens of the ability to enjoy good health daily.

Hypertension, heart disease, diabetes, weight loss/obesity and nutrition were all health needs identified by both the community members and health care professionals. In addition, deaths from female breast cancer and trachea, bronchus and lung cancer were identified as disproportionate for the county. Community members saw a need for increased education and preventive care in order to eliminate the path to chronic disease and cancer.

Prevention can be cost effective compared to the catastrophic treatment needed when a chronic disease is unmanaged and leads to major health problems. Education related to nutrition was emphasized because of the link between obesity and so many chronic health conditions. Other community health needs that were expressed included a need for increased health literacy, and decreased health disparities among socioeconomic and racial groups.

HANCOCK COUNTY

Hancock County similar health characteristics of communities within a rural state. Many of the health issues are lifestyle related and are greatly influenced by a variety of social determinants of health.

The top two leading causes of death in Hancock County are heart disease and cancer. The most prevalent cancers are trachea, bronchus, lung, and female breast cancer. The highest death rate from heart issues in Hancock County is deaths related to ischemic heart disease.

Ischemic heart disease and hypertensive heart disease, as well as trachea, bronchus, and lung cancer are strongly related to unhealthy lifestyles – poor nutritional choices and lack of exercise, plus tobacco use. During discussions within the Steering Committee and the Community Focus Group, it was decided access to trusted health information and educating the youth of the community would create a solid foundation for reducing these lifestyle-related deaths.
Prioritization

The Steering Committee understood the facts the primary and secondary data communicated in reference to the health of the citizens of Hancock County. These information sources included data gathered from state and federal sources such as the Mississippi Department of Health, the Center for Disease Control and Prevention, etc., community survey, community focus group, and key informant interviews. Community input is shared throughout this report.

Data presented in the assessment is the most recent data available and was gathered between August and November 2022. The CHNA Steering Committee reviewed this information and combined it with the empirical data gained from hands-on care experience. The next step was to determine the broader set of identified needs. Through this assessment process, identified needs were then narrowed to a set of significant needs which were determined most crucial for community stakeholders to address. Following the completion of the CHNA assessment, significant needs were further narrowed down to a set of prioritized needs that the hospital will address within the implementation strategy.

The criteria used to prioritize the significant needs were:

- Importance of the problem to the community
- Magnitude: the number of people impacted by the problem
- Severity: the risk of morbidity and mortality associated with the problem
- Alignment with health system priorities and available resources

The four main categories of need were determined to be:

- Access to and Continuity of Care
- Health Literacy and Education
- Mental and Behavioral Health
- Health Equity

The health issues identified will be narrowed to obtainable goals which Ochsner Medical Center – Hancock can, along with community partners, collaboratively address. The Community Health Implementation Plan (CHIP) will address the process. The hospital understands the importance of all the health needs of the community and is committed to playing an active role in improving the health of the people in the communities it serves. For the purposes of this implementation strategy, Ochsner Medical Center – Hancock has chosen to focus its efforts on the priorities listed above.
Thank You

This comprehensive assessment will allow us to better understand the needs and concerns of our community. Ochsner Medical Center – Hancock is proud to be part of Ochsner Health where we truly believe we are here to serve, heal, lead, educate and innovate. As always, through this commitment to compassionate and mission-focused health care, we are honored to work closely with our collaborative partners in our community to provide outstanding health care and create a healthier world for the residents of Hancock County and surrounding areas.

Our sincere thanks to all those who took part in this process. We are especially grateful to the members of the Ochsner family and the health system’s leadership. Through their guidance, we are able to continue our mission in our wonderful, coastal community in Mississippi.

Our CHNA Steering Committee members and all those who participated in our Community Focus Group, either by their attendance at the Forum or by conversations, deserve a special thanks for their time, support, and insight. Their input has been invaluable.

And last, but perhaps most importantly, to the general public who realize their voices do matter. Thank you for completing our Community Health Survey, reading our latest Community Health Needs Assessment, and for supporting our mission of care in Hancock County. We are grateful to be a part of this community – our community.

APPENDIX C
Hancock, MS

Rank #7 of 82 counties in Mississippi

**Health Outcomes**

Health outcomes represent how healthy a county is right now, in terms of length of life but quality of life as well.

Hancock (HA) is ranked among the healthiest counties in Mississippi (Highest 75%-100%).

![Health Outcomes Scale]

**Health Factors**

Health Factors represent those things we can modify to improve the length and quality of life for residents.

Hancock (HA) is ranked among the healthiest counties in Mississippi (Highest 75%-100%).
